
>Steel Balls for grinding

STOMANA INDUSTRY S.A.

Ostimentr eraup

Steel balls for grinding are produced in a range of $60-125 \mathrm{~mm}$ diameter. They are used in ore grinding mills, such as SAG (Semi Autogenous Grinding) mills when it is for initial grinding or ball mills for regrinding.

The most common applications of these steel balls are in gold, copper, iron, zinc, nickel and silver mining. Different hardness level of the product can be used depending on metal ore in order for grinding to be optimized.

During the manufacturing process Vacuum Degasser is used so to ensure high quality of final product by lowering its hydrogen and nitrogen content. The degasser was put into operation and brought about spectacular improvement in the quality of steel balls produced at Stomana Industry. The degassing of molten steel significantly lowers its hydrogen and nitrogen content. The use of the Vacuum Degasser yields high quality "pure steel", which in turn leads to high value-added finished products with technical characteristics and properties that can respond to the needs of the most demanding applications.

Vacuum degassing is performed only by top steel manufacturers in Europe and around the world. Equipped with the system, Stomana Industry is able to produce new qualities of alloy steels and target higher standard sectors.

| Steel chemical composition in \% |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| C | Mn | Si | P | S | Cu | Cr | Ni | Al |  |
| $0.60-1.00$ | $0.70-1.20$ | $0.25-0.50$ | max. 0.035 | max. 0.035 | max. 0.40 | max. 0.60 | max. 0.30 | $0.01-0.06$ |  |
